POPULATION SIZE, MIGRATION, DIVERGENCE, ASSIGNMENT, HISTORY

Bayesian inference using the structured coalescent

Migrate-n version 5.0.0a [May-20-2017]

Using Intel AVX (Advanced Vector Extensions)

Compiled for PARALLEL computer architectures

One master and 20 compute nodes are available.

Program started at Wed Oct 25 14:39:54 2017

Program finished at Fri Oct 27 00:00:56 2017 [Runtime:0001:09:21:02]

Options

Datatype: DNA sequence data

Inheritance scalers in use for Thetas:

All loci use an inheritance scaler of 1.0

[The locus with a scaler of 1.0 used as reference]

Random number seed: (with internal timer) 3897705656

Start parameters:

Theta values were generated

Using a percent value of the prior

M values were generated Using a percent value of the prior

Connection matrix:

m = average (average over a group of Thetas or M,

s = symmetric migration M, S = symmetric 4Nm,

0 = zero, and not estimated,

* = migration free to vary, Thetas are on diagonal

d = row population split off column population, D = split and then migration

Population 1 1 1 Romanshorn_0 * * 1 Arbon_1 * *

Order of parameters:

1 Θ_1 <displayed>

Mutation rate among loci: Mutation rate is constant for all loci

Analysis strategy: Bayesian inference

-Population size estimation: **Exponential Distribution**

Proposal distributions for parameter

Parameter Proposal Theta Metropolis sampling M Metropolis sampling Divergence Metropolis sampling Divergence Spread Metropolis sampling Genealogy Metropolis-Hastings

Prior distribution for parameter

Parameter Prior Minimum Mean Maximum Delta Bins UpdateFreq Theta -11 Uniform 1500 0.20000 0.000000 0.050 0.100 0.010

[-1 -1 means priors were set globally]

Markov chain settings: Long chain

Number of chains

50000 Recorded steps [a] Increment (record every x step [b] 200

2 Number of concurrent chains (replicates) [c] 20000000 Visited (sampled) parameter values [a*b*c]

10000 Number of discard trees per chain (burn-in)

Multiple Markov chains:

Static heating scheme 4 chains with temperatures

> 1000000.00 3.00 1.50 1.00

Swapping interval is 1

Print options:

Data file: infile.0.6

Haplotyping is turned on: NO

Output file: outfile_0.6_0.4

bayesfile

Raw data from the MCMC run: bayesallfile_0.6_0.4

Print data: No

Print genealogies [only some for some data type]: None

Posterior distribution raw histogram file:

Data summary

Data file: infile.0.6
Datatype: Sequence data
Number of loci: 10

Mutationmodel parameters

Bayesian Analysis: Posterior distribution over all loci

Log-Probability of the data given the model (marginal likelihood)

Use this value for Bayes factor calculations:

BF = Exp[In(Prob(D | thisModel) - In(Prob(D | otherModel) or as LBF = 2 (In(Prob(D | thisModel) - In(Prob(D | otherModel)) shows the support for thisModel]

Acceptance ratios for all parameters and the genealogies

Parameter	Accepted changes	Ratio
Θ_1 Genealogies	32257648/40004405 2135109/159995595	0.80635 0.01334

MCMC-Autocorrelation and Effective MCMC Sample Size

Parameter	Autocorrelation	Effective Sampe Size
$\Theta_1 \\ \text{Genealogies}$	0.08228 0.99647	847735.63 1706.27

Average temperatures during the run

Chain Temperatures 1 0.00000 2 0.00000 3 0.00000

Adaptive heating often fails, if the average temperatures are very close together try to rerun using static heating! If you want to compare models using marginal likelihoods then you MUST use static heating

Potential Problems

This section reports potential problems with your run, but such reporting is often not very accurate. Whith many parameters in a multilocus analysi s, it is very common that some parameters for some loci will not be very informative, triggering suggestions (for example to increase the prior ran ge) that are not sensible. This suggestion tool will improve with time, therefore do not blindly follow its suggestions. If some parameters are fla

gged, inspect the tables carefully and judge wether an action is required. For example, if you run a Bayesian inference with sequence data, for mac roscopic species there is rarely the need to increase the prior for Theta beyond 0.1; but if you use microsatellites it is rather common that your prior distribution for Theta should have a range from 0.0 to 100 or more. With many populations (>3) it is also very common that some migration rou tes are estimated poorly because the data contains little or no information for that route. Increasing the range will not help in such situations, reducing number of parameters may help in such situations.			
The their in each endauterie, reducing hamber of parameters may help in each endauterie.			
No warning was recorded during the run
